

Release Date: December 9, 2009

We are excited to release our new Skyfire 1.5 browser for Windows Mobile. The release improves rendering for newer, higher resolution devices, improves the overall user experience with an intuitive, finger-friendly user interface, and upgrades both our client & server for an even faster browsing experience.

This released version is 1.5.0.15020, and is for Windows Mobile only. It supports both touch (PPC) and non-touch screens (SMP).

Skyfire 1.5 for Symbian will include support for 3rd and 5th edition devices and will be released soon.

What's new in this release?

- **Full VGA support:** Skyfire now provides native support for the high resolution VGA and wVGA screens as available on many newer Windows Mobile phones. Web pages now render sharp and crisp with full fidelity
- **Finger friendly UI:** A new, intuitive, and finger friendly UI for high resolution phones provides an easier browsing experience
- **Smooth Scrolling:** Kinetic scrolling has been added to Skyfire. Pan or flick the screen to move in any direction smoothly
- **Full screen mode:** For touch screens, browse in full screen mode with no UI elements on the screen for maximum page visibility

Enhancements:

- **Auto-move text entry box when the (virtual keyboard) is used:** Assures that a text entry box moves into view in case the virtual (on-screen) keyboard covers it
- **Updated Flash and Silverlight:** Updated both to the newest version available
- **Updated Start Page:** Optimized for high resolution devices
- **Performance:** Upgraded both client and server for faster and more responsive browsing

Known Issues:

- On some newer HTC Touch screen devices auto-rotate may only work after a restart.

To install new version of Skyfire, click on the **upgrade notification** within Skyfire browser once available, or download Skyfire by pointing your mobile browser to **get.skyfire.com**.

Thanks,

Your Skyfire Team
